I've question about Object Destructuring ⋮

Lyudmil (/user/ventsi/) · Lecture 119 (/the-complete-web-developer-in-2018/learn/v4/t/lecture/8691778) · 3 months ago

Here, `const {player, experience}` , we have a bunch of variables and here `= obj;` we want to assign to them values from object properties. How does JavaScript engine know which value from `obj` to assign to `player` variable and which value to assign to `experience` variable?

Hi Lyudmil,

Because they are named the same as in the object. That's the megic behind object destructuring. Inside the curly braces, you write the object property names and after the equal sign you wrote the name of the object which holds the properties.

Have a look at the MDN Object Destructuring (https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Destructuring_assignment#Object_destructuring) docs for a very detailed explanation.

Cheers
